

Caminho Mínimo (3)

Zenilton Patrocínio

Caminho Mínimo entre Todos os Vértices

O problema consiste em determinar os caminhos mínimos entre todos os pares de vértices do grafo.

Se todos os custos forem positivos, para n vértices pode-se utilizar n repetições do método de Dijkstra → cada vez utiliza-se um vértice como raiz

- Custo → $n \times O(n^2) = O(n^3)$ para uma implementação trivial

Se houver custos negativos (sem a presença de ciclos negativos), para n vértices pode-se utilizar n repetições do método de Bellman-Ford (com m arestas)

- Custo → $n \times O(nm) = O(n^2m)$ → **$O(n^4)$!!!**

Método de Floyd-Warshall

Método de Floyd-Warshall

O algoritmo de Floyd-Warshall calcula os caminhos mais curtos entre todos os pares de vértices (consegue lidar arestas de peso negativo desde que não exista ciclo de custo negativo).

Trata-se novamente de um algoritmo de programação dinâmica.

Utiliza o conceito de **relaxação do comprimento dos caminhos** mais curtos de forma incremental aprimorando a estimativa de distância, até que o valor ótimo seja alcançado.

O algoritmo analisa os caminhos entre os vértices i e j passando por cada um dos k vértices intermediários possíveis, $k \in V(G)$.

Método de Floyd-Warshall

Considere que os vértices do grafo são numerados de 1 a n .

Seja $dist_{ij}^k$ a distância entre o par de vértices i e j usando como intermediários apenas os vértices do conjunto $\{1, 2, \dots, k\}$.

Em particular, $dist_{ij}^0 = d_{ij}$, se $\exists (i, j) \in E(G)$, $dist_{ij}^0 = \infty$, caso contrário. Além disso, $dist_{ii}^0 = 0$.

A relaxação do comprimento dos caminhos determina $dist_{ij}^k$ a partir das distâncias $dist_{**}^{k-1}$, isto é, utilizando um caminho de i para j que não passa por k ou o par de caminhos de i para k e de k para j (ambos não passando por k).

Método de Floyd-Warshall

i

j

Método de Floyd-Warshall

Método de Floyd-Warshall

Método de Floyd-Warshall

Método de Floyd-Warshall

Método de Floyd-Warshall

$$dist_{ij}^k = \min\{dist_{ij}^{k-1}, dist_{ik}^{k-1} + dist_{kj}^{k-1}\}$$

Método de Floyd-Warshall

$$dist_{ij}^k = \min\{dist_{ij}^{k-1}, dist_{ik}^{k-1} + dist_{kj}^{k-1}\}$$

se $dist[i,j] > dist[i,k] + dist[k,j]$ então
 $dist[i,j] \leftarrow dist[i,k] + dist[k,j]$

Método de Floyd-Warshall

$$dist_{ij}^k = \min\{dist_{ij}^{k-1}, dist_{ik}^{k-1} + dist_{kj}^{k-1}\}$$

se $dist[i,j] > dist[i,k] + dist[k,j]$ então
 $dist[i,j] \leftarrow dist[i,k] + dist[k,j]$

Para $k = 1, 2, \dots, n$

Método de Floyd-Warshall – Algoritmo

1. para $i = 1, \dots, n$ faça // Inicializar distâncias
 para $j = 1, \dots, n \mid j \neq i$ faça $\text{dist}[i, j] \leftarrow \infty$;
 $\text{dist}[i, i] \leftarrow 0$;
2. para toda aresta $(i, j) \in E(G)$ faça $\text{dist}[i, j] \leftarrow d_{ij}$;
3. para $k = 1, \dots, n$ faça // Para cada possível intermediário
 para $i = 1, \dots, n$ faça
 para $j = 1, \dots, n$ faça
 se $\text{dist}[i, j] > \text{dist}[i, k] + \text{dist}[k, j]$ então // Testar caminho de i para j
 $\text{dist}[i, j] \leftarrow \text{dist}[i, k] + \text{dist}[k, j]$; // Atualizar a distância

Recuperação dos Caminhos

Inicialização de Predecessor

prev[u][v] representa o penúltimo vértice no caminho de u para v (exceto no caso de $\text{prev}[v][v]$, onde sempre contém v mesmo que não haja loop em v)

1. para $i = 1, \dots, n$ faça
 para $j = 1, \dots, n \mid j \neq i$ faça
 $\text{dist}[i, j] \leftarrow \infty$;
 $\text{pred}[i, j] \leftarrow \emptyset$;
 $\text{dist}[i, i] \leftarrow 0$;
 $\text{pred}[i, i] \leftarrow i$;
2. para toda aresta $(i, j) \in E(G)$ faça
 $\text{dist}[i, j] \leftarrow d_{ij}$;
 $\text{pred}[i, j] \leftarrow i$;

Alteração do Método de Floyd-Warshall

```
para  $k = 1, \dots, n$  faça                                     // Para cada possível intermediário
    para  $i = 1, \dots, n$  faça
        para  $j = 1, \dots, n$  faça
            se  $\text{dist}[i, j] > \text{dist}[i, k] + \text{dist}[k, j]$  então // Testar caminho de i para j
                 $\text{dist}[i, j] \leftarrow \text{dist}[i, k] + \text{dist}[k, j];$  // Atualizar a distância
                 $\text{pred}[i, j] \leftarrow \text{pred}[k, j];$  // Atualizar predecessor
```
